

Present and Future of General Medicine Health Care Systems Compared

The different points of contact with the English healthcare system mean that a mutual exchange of experiences can foster greater understanding of future developments, the stage will take place through a high degree of interactivity and direct involvement in favorable organizational contexts, interested in training the positive factor of evolution.

It is planned attendance at both educational facilities and care, allowing each participant to verify directly the professional relationship, relational, social and organizational features of the environment; useful tool for the professional to understand the dynamics of the English NHS, comparing them with the Italian and draw starting point for possible corrections and / or applications.

Present and Future of General Medicine

Health Care Systems Compared

The Regional Health Plan is the practical application of the reform initiated by repayment plan through a reorganization of the network of services to upgrade the functions and provision of primary care and prevent hospitalization. Among the primary objectives: reduction of waiting lists with an increase of local services, reduction of improper access to the A&E network services responsible for prevention, diagnosis and treatment of chronic diseases through fully integrated hospital-home health assistance area, application of model "hub and spoke" systems of detection of customer satisfaction, clinical risk management standards according to the IJC, the regional network of palliative care and pain management (hospice); Strengthening activities cancer screening, prevention and treatment of stroke; efficiency of electronic links for diagnostic, radiological and laboratory.

General Practitioners are on the reform not only through internal structural changes - improving accessibility to and appropriateness of care, strengthening of the "clinical governance", chronic disease management through integrated management, .. - but also with its unique contribution through developing projects and new methodologies, as well as the basic training programs for their younger colleagues.
